$\text{R}^1$  is hydrogen or methyl;

$\text{R}^2$  is  $(\text{C}_1-\text{C}_3)$ -alkyl,  $-\text{CH}_2\text{C}(\text{O})\text{NH}_2$  or  $-\text{CH}(\text{CH}_3)\text{C}(\text{O})\text{NH}_2$ ;

comprising reacting a compound of formula I wherein R<sup>2</sup> is hydrogen, with an alkylating agent.

- 5 Examples for alkylating agents include halides, tosylates, mesylates and triflates.

In accordance with the present invention, compounds of general formula I wherein X-X' and Y-Y' are -CH<sub>2</sub>-CH<sub>2</sub>- can, e.g., be manufactured as described as follows:

With the benzazepine derivative V [J.Heterocycl.Chem. (1971) 8(5), 779-783] as starting material, compounds of formula I, wherein R<sup>2</sup> is hydrogen and X-X' and Y-Y' are -CH<sub>2</sub>-CH<sub>2</sub>-, can be obtained using suitably protected benzazepine derivatives of formula VI. As amino protecting groups P<sup>1</sup> can be selected those, that can be cleaved in the presence of the benzyl residue to be introduced in the following step, e.g. tert-butoxycarbonyl, methoxycarbonyl, or 9-fluorenyl-methoxycarbonyl.

- 15 The alkylation of the phenol VI is effected according to methods which are known per se in the presence of a base, such as potassium carbonate or cesium carbonate. Chlorides, bromides, iodides, tosylates or mesylates come into consideration as alkylating agents. The reaction is effected in a solvent which is inert under the reaction conditions, such as e.g. acetone, methyl ethyl ketone, or N,N-dimethylformamide, at a temperature between about 0°C and 140°C. As an alternative approach, the Mitsunobu reaction of optionally substituted benzylalcohols in inert solvents, such as e.g. diethyl ether or tetrahydrofuran, using dialkyl-azo-dicarboxylates, e.g. diethyl or diisopropyl-azo-dicarboxylates, in the presence of phosphines, such as e.g. triphenyl- or tributylphosphine, leads to ethers of formula VII. Especially in benzyl derivatives of formula VII with R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> =
- 25 hydrogen, the benzyl group can be used as protecting group and, after its cleavage by hydrogenolysis, be replaced at a later stage by differently substituted benzyl groups using methods mentioned before.

- For the preparation of amines of formula I, i.e. wherein R<sup>2</sup> is hydrogen, the protecting group has to be cleaved in an appropriate way depending on the nature of P<sup>1</sup> generally known to the expert in the field, e.g. by cleavage under acidic conditions in case of the
- 30

tert-butoxycarbonyl group, or under basic conditions in case of the methoxycarbonyl- or 9-fluorenyl-methoxycarbonyl group.

The derivatisation of compounds of formula I wherein  $R^2$  is hydrogen can lead directly to compounds of formula I wherein  $R^2$  is  $(C_1-C_3)$ -alkyl,  $-CH_2C(O)NH_2$ ,  $-CH(CH_3)C(O)NH_2$ ,  $-S(O)_2CH_3$  or  $-C(O)R^6$ . When  $R^2$  is an acyl residue, activated acid derivatives, such as e.g. an acid chloride or anhydride, can be used or condensation methods for acids and amines known per se can be applied. When  $R^2$  is an alkoxycarbonyl residue, chloroformates can be used. When  $R^2$  is an aminocarbonyl residue, isocyanates, e.g. trimethylsilyl-isocyanate or alkyl-isocyanates can be used. When  $R^2$  is a sulfonyl residue, activated derivatives, such as e.g. a sulfonyl chloride or anhydride, can be used. When  $R^2$  is representing an alkyl residue, the alkylation is effected according to methods which are known per se in the presence of a base, such as potassium carbonate or cesium carbonate with chlorides, bromides, iodides, tosylates or mesylates as the alkylating agent. The reaction is effected in a solvent which is inert under the reaction conditions, such as e.g. acetone, methyl ethyl ketone, or N,N-dimethylformamide, at a temperature between about  $0^\circ\text{C}$  and  $140^\circ\text{C}$ .

The derivatisation of compounds of formula I wherein  $R^2$  is hydrogen can also be achieved via compounds of formula IX, wherein  $R^{2.1}$  contains a functional group that can be transformed in  $R^2$ , such as e.g. an alkyl ester which by ammonolysis is transformed into the corresponding amide.

Compounds of formula IX can be obtained directly via compounds of formula VIII for  $R^{2.1}$  representing an acyl, alkoxycarbonyl, or sulfonyl residue. Compounds of formula VIII can be prepared using procedures as described before in the case of the derivatisation of compounds of formula I wherein  $R^2$  is hydrogen.

Compounds of formula I wherein  $X-X'$  is  $-\text{CH}=\text{CH}-$  and  $Y-Y'$  is  $-\text{CH}_2-\text{C(O)}-$  can be obtained as outlined as follows via the intermediate 8-hydroxy-1,3-dihydrobenzo[d]azepin-2-one (XII) and procedures known from the literature or in close analogy thereof, e.g. as described in J.Med.Chem. 33 (5) 1496-1504 (1990).

30

Starting with the condensation of activated derivatives of 3-hydroxyphenylacetic acid wherein  $R^9$  has the meaning of methyl or benzyl [Synthesis 9, 1214-1216 (2000)], the reaction with aminoacetaldehyde acetal, wherein  $R^{10}$  has the meaning of e.g. methyl or ethyl, leads to amide XI. The ring closure to the seven-membered cycle can be performed  
 5 under acid conditions, such as e.g. concentrated hydrochloric acid in acetic acid or polyphosphorous acid, under, at least partial, loss of group  $R^9$  to yield the azepinone XII.

The further derivatisation to compounds of formula I follows procedures already described above.

When  $R^2$  is an acyl, alkoxycarbonyl, or sulfonyl residue, compounds of formula I can be  
 10 obtained following procedures already described above. When  $R^2$  is alkyl, the alkylation is effected according to methods known per se in the presence of a base, such as e.g. alcoholates, like potassium tert-butanolate, or hydride, like sodium hydride, with chlorides, bromides, iodides, tosylates or mesylates as the alkylating agent and in solvents such as e.g. dimethylsulfoxide, N,N-dimethylformamide or THF.

Compounds of formula I wherein X-X' is  $-\text{CH}_2-\text{CH}_2-$  and Y-Y' is  $-\text{CH}_2\text{C}(\text{O})-$  can be obtained via the intermediate XIII by methods described above. The azepinone XIII can be obtained by hydrogenation of XII.

20 Compounds of formula I wherein X-X' is  $-\text{CH}_2\text{C}(\text{O})-$  and Y-Y' is  $-\text{CH}=\text{CH}-$  can be prepared starting from intermediates of formula XVI or XVI-1 as outlined as follows by methods already described above.

The intermediate azepinone XVI can be obtained in different ways:

(a) Following a procedure, described in Heterocycles 9 (9), 1197 (1978) for the synthesis  
 25 of the corresponding six-membered cycle, acylation of phenethylamine XIV by dialkoxy-

acetyl chloride yields the dialkoxy-acetamide XV which is cyclised to the azepinone XVI by acid, such as e.g. concentrated sulfuric acid. Herein, R<sup>10</sup> can have the meaning of methyl or benzyl, representing transient groups which, at least partially, can be lost during the cyclisation procedure.

(b) Alternatively, following the procedure described in Chem.Pharm.Bull. 37 (4) 939-943 (1989), the cyclisation to the azepinone XVI can be performed by a Pummerer-type reaction, via the sulfide XVIII, its oxidation, e.g. by sodium metaperiodate, to the  $\alpha$ -(methylsulfinyl)acetamide XX ( $R^{11}$  = methyl) and cyclisation to the azepinone XX by acid treatment, e.g. 4-toluenesulfonic acid, or by treatment with trifluoroacetic anhydride. The desulfurisation of XX by Raney nickel yields azepinone XXI or XVI depending on the protecting group  $P^2$ .  $P^2$  can represent a typical amino protecting group, such as e.g. tert-butoxycarbonyl or benzyloxycarbonyl.

- (c) The unsaturated analogue of formula XXIV can be obtained in analogy to a procedure described in Chemistry-A European Journal 7 (24), 5286-5298 (2001), wherein the vinyl iodide of formula XXII reacts with the dialkoxy-acetamide in the presence of copper(I) thiophene-2-carboxylate and a base to yield the enamide XXIII.
- 5 Cyclisation under acidic conditions, as described before, gives the azepinone XXIV (e.g.  $R^9$  = methyl).

- The compound of formula XXII can be prepared starting from the corresponding alpha,beta-unsaturated aromatic carboxylic acids by oxidative halodecarboxylation as described e.g. in Tetrahedron Letters 42 (52) 9253 (2001), followed by transhalogenation to the corresponding iodide as described in e.g. Synthesis (3), 236 -238 (1988).

- Ring expansion reactions as known to those skilled in the art can lead to compounds of formula XXX and XVI-1. Examples of such reactions are outlined as follows, like e.g. the Schmidt rearrangement or the Beckmann rearrangement, both starting, e.g., from the commercially available 6-methoxy-2-tetralone (XXV).

Treatment of XXV with hydrazoic acid yields a mixture of azepinones of formula XXX and XVI-1 which, after separation, can be transformed to compounds of general formula XIII or I, respectively. The separation can also take place at a later stage of the synthesis.

In an analogous way, via the oxime XXVI by its rearrangement after treatment with reagents such as e.g. phosphorous pentachloride, sulfuric acid or polyphosphoric acid, a mixture of azepinones of formula XXX and XVI-1 can be obtained.

Another approach to obtain azepinones of formula XVI-1 is given by the oxidative ring expansion of an isoquinoline enamide of formula XXVII [compound of formula XXVII can be prepared as described in Tetrahedron Letters 43 (29) 5089-5091 (2002) for R<sup>9</sup> = methyl or as described in Bioorg .Med.Chem.Lett. 13 (17), 2853 (2003)] by lead  
 5 tetraacetate as described in J.Org.Chem. 53, 5793-5796 (1988).

Pharmaceutically acceptable salts of compounds of formula I can be manufactured readily according to methods known per se and taking into consideration the nature of  
 10 the compound to be converted into a salt. Inorganic or organic acids such as, e.g., hydrochloric acid, hydrobromic acid, sulphuric acid, nitric acid, phosphoric acid or citric acid, formic acid, fumaric acid, maleic acid, acetic acid, succinic acid, tartaric acid, methanesulphonic acid, p-toluenesulphonic acid and the like are suitable for the formation of pharmaceutically acceptable salts of basic compounds of formula I.

15 The following examples are provided to illustrate the preparation of some examples for compounds of formula I. They should not be considered as limiting the scope of the invention, but merely as being representative thereof. The term „room temperature“ was abbreviated as „RT“.

20 Compounds of formula I and their pharmaceutically acceptable salts, as individual isomers of the compounds of formula I as well as racemic and non-racemic mixtures thereof (hereinafter: Pharmaceutical Compound) have pharmacological activity and are useful as pharmaceuticals. In particular, Pharmaceutical Compounds selectively inhibit the activity of monoamine oxidase B.

25 The pharmacological activity of the Pharmaceutical Compounds may be demonstrated, e.g. as follows:

The cDNA's encoding human MAO-A and MAO-B were transiently transfected into EBNA cells using the procedure described by Schlaeger and Christensen [Cytotechnology 15:1-13 (1998)]. After transfection, cells were homogenised by means of a Polytron homogenizer in 20 mM Tris HCl buffer, pH 8.0, containing 0.5 mM EGTA and 0.5 mM phenylmethanesulfonyl fluoride. Cell membranes were obtained by centrifugation at 45,000 x g and, after two rinsing step with 20 mM Tris HCl buffer, pH 8.0, containing 0.5

mM EGTA, membranes were eventually re-suspended in the above buffer and aliquots stored at -80°C until use.

- MAO-A and MAO-B enzymatic activity was assayed in 96-well-plates using a spectrophotometric assay adapted from the method described by Zhou and Panchuk-Voloshina [Analytical Biochemistry 253:169–174 (1997)]. Briefly, membrane aliquots were incubated in 0.1 M potassium phosphate buffer, pH 7.4, for 30 min at 37°C with or without various concentrations of the compounds. After this period, the enzymatic reaction was started by the addition of the MAO substrate tyramine together with 1 U/ml horse-radish peroxidase (Roche Biochemicals) and 80 µM N-acetyl-3,7,- dihydroxyphenoxazine (Amplex Red, Molecular Probes). The samples were further incubated for 30 min at 37°C in a final volume of 200 µl and absorbance was then determined at a wavelength of 570 nm using a SpectraMax plate reader (Molecular Devices). Background (non-specific) absorbance was determined in the presence of 10 µM clorgyline for MAO-A or 10 µM L-deprenyl for MAO-B.
- IC<sub>50</sub> values were determined from inhibition curves obtained using nine inhibitor concentrations in duplicate, by fitting data to a four parameter logistic equation using a computer program.

The compounds of the present invention are specific MAO-B inhibitors. The IC<sub>50</sub> values of compounds of formula I as measured in the assay described above are in the range of 10 µM or less, typically of 1 µM or less, and ideally 0.1 µM or less. The below table shows exemplary IC<sub>50</sub> values:

Pharmaceutical Compounds are accordingly useful as selective inhibitors of monoamine oxidase B, e.g. in the treatment or prevention of diseases and conditions in which activity

of monoamine oxidase B plays a role or is implicated. Such conditions include in particular acute and/or chronic neurological disorders.

Acute and/or chronic neurological disorders include psychosis, schizophrenia, Alzheimer's disease, cognitive disorders and memory deficits like mild cognitive impairment, age-related cognitive decline, vascular dementia, Parkinson's disease, memory impairment associated with depression or anxiety, Down's syndrome, stroke, traumatic brain injury, and attention deficit disorder. Other treatable indications are restricted brain function caused by bypass operations or transplants, poor blood supply to the brain, spinal cord injuries, head injuries, hypoxia caused by pregnancy, cardiac arrest and hypoglycaemia. Further treatable indications are acute and chronic pain, Huntington's chorea, amyotrophic lateral sclerosis (ALS), dementia caused by AIDS, eye injuries, retinopathy, idiopathic parkinsonism or parkinsonism caused by medicaments as well as conditions which lead to glutamate-deficient functions, such as e.g. muscle spasms, convulsions, migraine, urinary incontinence, nicotine addiction, psychotic episodes, opiate addiction, anxiety, vomiting, dyskinesia and depression.

In one embodiment, the acute and/or chronic neurological disorder is Alzheimer's disease. In another embodiment, the acute and/or chronic neurological disorder is mild cognitive impairment or senile dementia.

As used herein, a mammal in need of treatment of an acute and/or chronic neurological disorder means a mammal, e.g. a human, that is suffering from, or is at risk of suffering from, an acute and/or chronic neurological disorder.

As used herein, the terms „treat“, „treating“ and „treatment“, and the like, as applied to an acute and/or chronic neurological disorder, refer to methods that slow, ameliorate, reduce or reverse such a disorder or any symptoms associated with said disorder, as currently afflicting the subject, as well as methods that prevent such a disorder or any symptoms thereof, from occurring.

Pharmaceutical Compounds can be used as medicaments, e.g. in the form of pharmaceutical preparations. The pharmaceutical preparations can be administered orally, e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions. However, the administration can also be effected rectally, e.g. in the form of suppositories, or parenterally, e.g. in the form of injection solutions.

“Pharmaceutically acceptable” such as pharmaceutically acceptable carrier, excipient, etc., means pharmacologically acceptable and substantially non-toxic to the subject to which the particular compound is administered.

“Therapeutically effective amount” means an amount that is effective to prevent, alleviate  
5 or ameliorate symptoms of disease or prolong the survival of the subject being treated.

Further objects of the invention are medicaments based on a compound in accordance with the invention and their manufacture as well as the use of the compounds in the control or prevention of diseases mediated by monoamine oxidase B inhibitors, and, respectively, for the production of corresponding medicaments.

10 Pharmaceutical Compounds can be processed with pharmaceutically inert, inorganic or organic carriers for the production of pharmaceutical preparations. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts and the like can be used, e.g., as such carriers for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carriers for soft gelatine capsules are, e.g., vegetable oils, waxes, fats, semi-solid and liquid polyols  
15 and the like; depending on the nature of the active substance no carriers are, however, usually required in the case of soft gelatine capsules. Suitable carriers for the production of solutions and syrups are, e.g., water, polyols, sucrose, invert sugar, glucose and the like. Adjuvants, such as alcohols, polyols, glycerol, vegetable oils and the like, can be used for aqueous injection solutions of water-soluble salts of compounds of formula I, but as a  
20 rule are not necessary. Suitable carriers for suppositories are, e.g., natural or hardened oils, waxes, fats, semi-liquid or liquid polyols and the like.

In addition, the pharmaceutical preparations can contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They may also contain  
25 other therapeutically valuable substances.

As mentioned earlier, medicaments containing Pharmaceutical Compound and a therapeutically inert excipient are also an object of the present invention, as is a process for the production of such medicaments which comprises bringing one or more Pharmaceutical Compounds and, if desired, one or more other therapeutically valuable  
30 substances into a galenical dosage form together with one or more therapeutically inert carriers.

The dosage can vary within wide limits and will, of course, be fitted to the individual requirements in each particular case. In general, the effective dosage for oral or parenteral

administration is between 0.01-20 mg/kg/day, with a dosage of 0.1-10 mg/ kg/day being preferred for all of the indications described. The daily dosage for an adult human being weighing 70 kg accordingly lies between 0.7-1400 mg per day, preferably between 7 and 700 mg per day.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/EP2004/011541

### Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 22, 23  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 22 and 23 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
